-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE <u>3</u> MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.
- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
  Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on <u>03 November 2005</u>.

2a)☐ This action is **FINAL**.   2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-29* is/are pending in the application.

    4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1-29* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

    Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

    Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

    a)☐ All b)☐ Some * c)☐ None of:

      1.☐ Certified copies of the priority documents have been received.

      2.☐ Certified copies of the priority documents have been received in Application No. _____.

      3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

DETAILED ACTION

This office action is responsive to Amendment filed on 5/19/2005. The

Amendment has been entered.

Claims 1-29 are pending.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for

all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

1.   Claims 1-5, 6 and 8, are rejected under 35 U.S.C. 103(a) as being

unpatentable over Lu, US (5,412,652) in view of Takatori, US (5,550,805) and

further in view of Swinkels et al, US (6,795,394), hereinafter referred to as Lu,

Takatori and Swinkels respectively.

Referring to claim 1, Lu discloses a method for a communications

network including a protect channel transmitting protect channel data (protection

channels that transmit extra traffic (see figure 5 and column 8 lines 24-40) and

working channel transmitting working channel data (a working channel that

transmits normal traffic (see figure 5 and column 8 lines 24-40)), the method

comprising transmitting the working channel data via the protect channel upon a

disruption in the working channel (when the working traffic fails the protection

traffic is preempted (see column 8 lines 24-40)), and restoring the transmitting of

protected channel data (when the failure has been rectified, full recovery is

realized through the use of the ring table (see column 13 lines 61 through column

14 line 3)), wherein restoring includes applying a restoration protocol to the

communications network to restore the transmittal of the protect channel data (a

protocol is used to recovery from the failure and the network is restored to its

previous state, thus the protect channel is restored (see column 13 lines 61

through column 14 line 3)).

Lu does not disclose that the restoration protocol is a 'mesh' restoration

protocol. However, Takatori discloses a failure restoration system wherein a

failure is restored using a mesh restoration protocol (see abstract and figures 1-

4).

Therefore, It would have been obvious to one skilled in the art at the time

of the invention to implement this type of network restoration protocol in Lu

because mesh networks are very reliable since each node is connected to all

other nodes and thus many protection paths can exist.

Lu in view of Takatori do not disclose restoring transmission of the protect

channel data on an alternate channel other than the protect channel, the

alternate channel transmits the protect channel data from a first communications

network node to a second communications network node via a mesh node. (In

accordance with the specification, this limitation is interpreted by the Examiner to

mean that protection traffic is routed over another protection route including

nodes in a protection ring, an intermediate node in the network and the

destination node).

However, Swinkels discloses restoring the transmittal of protect channel

data on an alternate channel, using meshed paths, wherein nodes in the meshed

path makes routing decisions for the protected extra traffic. See figure 6, steps

300-320, column 4, lines 1-4, column 2, lines 59-65, and column 7, lines 28-44,

column 9,lines 1-7. (Examiner interpreted the alternative path for the transmittal

of the extra traffic using nodes along a protection path as been the claimed

restoring the transmittal of protect channel data on an alternate channel, the

alternate channel transmits the protect channel data from a first communications

network node to a second communications network node via a mesh node).

Therefore, It would have been obvious to one skilled in the art at the time

of the invention to implement the restoring of the extra traffic of Lu in view

Takatori in accordance with the method of Swinkels so to prevent the dropping of

extra traffic upon disruption in the working path. The advantage would be better

bandwidth utilization in the system of Lu in view of Takatori.

Referring to claim 2, Lu in view of Takatori discloses the system discussed

above. Takatori further disclose a distributed mesh restoration protocol (see

figures 1-4).

Referring to claims 3, 5, 6 and 8, Lu in view of Takatori and further in view

of Swinkels disclose the system discussed above. Furthermore, Lu discloses that

the protect channel data is at least one of video, voice and data (the protect

channels transmit extra traffic (see column 8 lines 24-40)). Wherein the

communications network is one of a Synchronous Optical Network (SONET) and

a Synchronous Digital Hierarchy (SDH) (the Lu system is implemented in a

SONET system (see abstract)).

Wherein the communication network includes a plurality of interconnected

nodes, the interconnected nodes having at least one of a working channel and a

protect channel (the network nodes include working and protecting channels (see

figures 1 and 2));

Wherein the mesh restoration protocol includes communicating status

and control messages across a physical network layer of the communication

network (the ring tables are transmitted among the network nodes for restoring

the network, this is inherently done using the physical layer (columns 13 and

14)).

Referring to claim 4, Lu in view of Takatori and further in view of Swinkels

discloses routing protection data on alternate path as discussed above, but do

not explicitly specify that the alternate channel includes a working and protect

channel.

However, since a mesh network consist of node each having connection

to each one other node in the network, it would have been obvious to an ordinary

person of skill in the art, at the time of the invention to take advantage of

available routes including both connected working and protection paths in the .

mesh network of Lu in view of Takatori and further in view of Swinkels so to use

the bandwidth in more efficient way.

2.   Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Lu

in view of Takatori and further in view of Swinkels and further in view of Shah et

al, US (5,646,936), hereafter referred to as Shah.

Referring to claim 7, Lu in view of Takatori and further in view of Swinkels

disclose the system discussed above. Lu in view of Takatori and further in view

of Swinkels do not specify that the plurality of interconnected nodes transmits a

disruption signal upon receiving a signal indicating the disruption, the disruption

signal flooding the communication network to determine alternate routes for the

protect channel data. However, Shah discloses of a path restoration technique

wherein when a link disruption takes place alternate paths are set up through the

use of flooding the network with messages about the disruption (see figure 1 and

column 1 lines 51-63). It would have been obvious to one skilled in the art at the

time of the invention to implement this feature in the system of Lu in view of

Takatori and further in view of Swinkels because doing so would make Lu in view

of Takatori and further in view of Swinkels more robust since it would exhaust

efforts in finding alternate routes and not rely on a single alternate route.

3.   Claims 9-11 are rejected under 35 U.S.C. 103(a) as being unpatentable

over Lu in view of Takatori and further in view of Swinkels and further in view of

Shioda et al, US (5,537,393), hereafter referred to as Shioda.

Referring to claims 9-11, Lu in view of Takatori and further in view of

Swinkels discloses the system discussed above. Lu in view of Takatori and

further in view of Swinkels does not disclose that the status and control

messages are communicated using SONET frame overhead bytes, out-of-band

communications channels or a distributed routing protocol. However, Shioda

discloses a system wherein a restoration protocol is implemented to restore

protection channel data (see column 7) and wherein status and control

information is communicated in frame overhead bytes (see column 7), which can

be considered out-of-band channels and which are inherently designated

(distributed) according to a protocol (see columns 7 and 8). It would have been

obvious to one skilled in the art at the time of the invention to implement these

features into Lu in view of Takatori and further in view of Swinkels because

communicating this information out-of-band, in overhead byte and according to a

distribution protocol would make Lu in view of Takatori and further in view of

Swinkels more bandwidth efficient and resourceful.

4.   Claims 12-18, 20-25 and 27-29 are rejected under 35 U.S.C. 103(a) as

being unpatentable over Shioda in view of Takatori and further in view of

Swinkels.

Referring to claims 12, 21 and 29, Shioda discloses an apparatus

disposed in a communication network having a protect channel and a working

channel (a node in a network that has working and protection lines (see figure

1)), the apparatus comprising a node controller (the nodes have CPUs (see

column 4 lines 25-33)), a route processor coupled to the node controller, the

route processor implementing a restoration protocol (the nodes performs the

restoration of working and protection lines (see columns 7 and 8)), a circuit

coupled to the node controller and the route processor, the circuit including a logic gate for receiving signals identifying disruptions in transmissions in the protect channel and the working channel (a AIS generator and comparator identify disruptions in the working and protection paths (see columns 7 and 8)), a switch responsive to the signals identifying disruptions in transmissions in the protect channel and the working channel (the data from the working path is switched to the protection path (see columns 7 and 8)), the switch communicating the route processor to implement restoration of protect channel data (the data is switched from the working and or protection lines to other working and/or protection lines (see columns 7 and 8)).

Shioda does not disclose that the restoration protocol is a 'mesh' restoration protocol.

However, Takatori discloses a failure restoration system wherein a failure is restored using a mesh restoration protocol (see abstract and figures 1-4). It would have been obvious to one skilled in the art at the time of the invention to implement this type of network restoration protocol in Shioda because mesh networks are very reliable since each node is connected to all other nodes and thus many protection paths can exist.

Note regarding claim 29, Shioda does not disclose that the system is implemented in a program. However, it would have been obvious to one skilled in the art at the time of the invention to implement the Shioda system in this manner because the developmental costs of a software implementation are less than that

of a hardware based implementation. Furthermore, software is easier to upgrade
than hardware.

Shioda in view of Takatori do not disclose the transmittal of the protect
channel data on a channel other than the protect channel by transmitting the
protect channel data from a first communications network node to a second
communications network node via a mesh node.

However, Swinkels discloses restoring the transmittal of protect channel
data on a channel other than the protect channel, using meshed paths, wherein
nodes in the meshed path makes routing decisions for the protected extra traffic.
See figure 6, steps 300-320, column 4, lines 1-4, column 2, lines 59-65, and
column 7, lines 28-44, column 9,lines 1-7. (Examiner interpreted the alternative
path for the transmittal of the extra traffic as been the claimed restoring the
transmittal of protect channel data on a channel other than the protect channel,
because the working traffic is switched over the protection path, and since the
protection path is used by the working traffic, the alternate path is not the
protection path, see figure 6, in addition, using nodes along a mesh protection
path of Swinkels reads on the claimed alternate channel transmits the protect
channel data from a first communications network node to a second
communications network node via a mesh node)).

Therefore, It would have been obvious to one skilled in the art at the time
of the invention to implement the restoring of the working traffic of Shioda in view
of Takatori in accordance with the method of Swinkels so to prevent the dropping

of protected traffic upon disruption in the working path. The advantage would be better bandwidth utilization in the system of Shioda in view of Takatori.

Referring to claim 13, Shioda in view of Takatori and further in view of Swinkels disclose the system discussed above. Furthermore, Shioda discloses that the circuit is coupled to at least one line card, the line card transmitting the signals identifying disruptions in transmissions in the protect channel and the working channel (the AIS signals are transmitted over the working and protection lines to indicate disruptions, note the circuits are inherently implemented on cards (see columns 7 and 8 and figure 7)).

Referring to claim 14, Shioda in view of Takatori and further in view of Swinkels disclose the system discussed above. Furthermore, Shioda discloses that the circuit includes an input/output circuit for receiving instructions identifying criteria for applying mesh restoration to protect channel data (when the ID's do not match the path is considered disrupted, thus this is the criteria used (see columns 7 and 8 and figure 7)).

Referring to claim 15, Shioda in view of Takatori and further in view of Swinkels disclose the system discussed above. Shioda does not disclose that the criteria are a function of the type of data being transmitted as the protect channel data. However, it would have been obvious to one skilled in the art at the time of the invention to base the criteria on data type because different data types have different transmission requirements (e.g. voice data requires low delay), thus basing the criteria on the data type in Shioda will make Shioda in view of Takatori and further in view of Swinkels system more flexible and reliable.

Referring to claims 16-18, 20, 22-25 and 28, Shioda in view of Takatori

and further in view of Swinkels disclose the system discussed above.

Furthermore, Shioda discloses that the protect channel data includes at least one

of voice, video and data (data is transmitted in the SPE of the frames of the

system (see figure 1));

wherein the communications network is one of a Synchronous Optical

Network (SONET) and a Synchronous Digital Hierarchy (SDH) (the system uses

the SONET protocol (see abstract and figure 1));

wherein the communication network includes a plurality of interconnected

nodes, the interconnected nodes having at least one of a working channel and a

protect channel (the network has interconnected nodes and working and

protection channels (see figure 1)).

Wherein the route processor implements a mesh restoration protocol that

includes communicating status and control messages across SONET overhead

bytes of the communication network (the Shioda system uses overhead bytes to

implement the protection system (see columns 7 and 8));

wherein the means for restoring further includes means for finding one or

more alternate channels to transmit the protected channel data, the one or more

alternate channels including connected working and protect channels (the PCA

data can be rerouted over another protection path or over a working path of

another subscriber (see columns 7 and 8 and figure 7));

wherein the apparatus includes a plurality of circuits disposed in a

plurality of linked nodes, each circuit coupled to a node controller associated with

one of the plurality of linked nodes (the nodes comprise many circuits and are in

a network of linked nodes and the nodes have CPUs (see figures 2 and 7)).

Referring to claim 27, Shioda in view of Takatori and further in view of

Swinkels disclose the system discussed above, but do not specify that the

apparatus is in a management bay with a plurality of other cards. However, It

would have been obvious to one skilled in the art at the time of the invention to

implement the nodes of Shioda in view of Takatori and further in view of Swinkels

in this fashion because doing so would give network technicians a well-confined

and organized way of performing operation, testing, repairing and maintenance

operations, thus making the Shioda in view of Takatori and further in view of

Swinkels system more user friendly. This is particularly important because since

disruptions are occurring it is important to repair the network elements that are

malfunctioning and causing these disruptions as quickly as possible, thus

implementing nodes in this well-confined and organized manner will help improve

the timing and quality of such repairs.

5.   Claims 19 and 26 are rejected under 35 U.S.C. 103(a) as being

unpatentable over Shioda in view of Takatori and further in view of Swinkels and

further in view of Shah.

Referring to claims 19 and 26, Shioda in view of Takatori and further in

view of Swinkels disclose the system discussed above, but do not specify that

the plurality of interconnected nodes transmits a disruption signal upon receiving

a signal indicating the disruption, the disruption signal flooding the

communication network to determine alternate routes for the protect channel

data. However, Shah discloses of a path restoration technique wherein when a

link disruption takes place alternate paths are set up through the use of flooding

the network with messages about the disruption (see figure 1 and column 1 lines

51-63). It would have been obvious to one skilled in the art at the time of the

invention to implement this feature in the system of Shioda in view of Takatori

and further in view of Swinkels because doing so would make Shioda in view of

Takatori and further in view of Swinkels more robust since it would exhaust

efforts in finding alternate routes and not rely on a single alternate route.

Response to Arguments

6. Applicant's arguments filed 5/19/2005 have been fully considered but they

are not persuasive:

Claim 1:

Applicant argues among other things that Swinkels does not disclose

restoring protect channel data by transmitting protect channel data from a first

node to a second node via a mesh node, Examiner respectfully disagrees,

because, Swinkels contrary to Applicants remarks, discloses having mesh

protection paths having nodes along the protection paths, each node makes a

routing decision for the protected extra traffic. See column 9, lines 1-7.

Applicant did not show support in the specification with regard to the first

node, second node and mesh node. Does the first node is the source node, and

the second node a destination node, and what is meant by a mesh node in

accordance with the specification. Applicant is kindly required to clarify this

added elements in the independent claims in response to this office action.

Claim 4:

Argument with reference to claim 4 is moot in view of new ground of

rejection.

Claim 12:

Applicant argument with reference to claim 12 is similar in content to that

of base claim 1, thus similar response as indicated to claim 1 above applies.

Claims   2-3, 5, 6 -9, 13-25, and 26-29

Applicant argues that since this claims depend from base claims, they are

patentable. Examiner respectfully disagrees since the respective precedent

claims are not patentable, in addition to the rejections indicated above.

Conclusion

7.   The prior art made of record and not relied upon is considered pertinent to

applicant's disclosure: Agarwal et al, US 2001/0038471.
